1. DESIGNS FOR DIESEL-ELECTRIC GENERATING PLANTS. This course discusses the design of diesel-electric generating plants for facilities where utility power is not available. 1.1 DIESEL-ELECTRIC GENERATING PLANTS. Rotational speed and Break Mean Effective Pressure (BMEP) limits are summarized in Table 1 for various unit generator sizes and duties.

Introduction to Diesel-Electric Generating Plants

Although steam power stations and hydro-electric plants are invariably used to generate bulk power at cheaper cost, yet diesel power stations are finding favour at places where the demand for power is less, sufficient quantity of coal and water is not available and the transportation facilities are inadequate. These plants are also used as standby sets for continuity of supply to important points such as hospitals, radio stations, cinema houses and telephone exchanges.

In this manual we will cover the Diesel Engine operated power plants viz., diesel power plants which are used to generate Electrical power. Today diesel engines are available in many sizes but engines used for three phase power generation are mostly in the range of 7.5 kW to around 20000 kW. 1.6 Engine types.

Marine propulsion is the mechanism or system used to generate thrust to move a ship or boat across water. While paddles and sails are still used on some smaller boats, most modern ships are propelled by mechanical systems consisting of an electric motor or engine turning a propeller, or less frequently, in pump-jets, an impeller. Marine engineering is the discipline concerned with the
