Enteral feeding formulae are about 70-80% water and the remainder of the volume consists of solids that are not used as fluid by the body. For accurate calculation of fluid input (eg to meet requirements, or for fluid restrictions), it is important to use the formula's actual water content, not the total volume of formula being given.

Enteral nutrition manual for adults in health care facilities

INTRODUCTION. Enteral nutrition (EN) is the preferred mode of nutrient intake in critically ill children with a functioning gut 1. In a recent international study of nutrient intake in mechanically ventilated patients, we reported a significantly lower odds of 60-day mortality in patients with greater adequacy of enteral nutrient delivery 2. However, despite the preference for EN, there are a ...
