Abstract. These are two methods of representing a dynamic system and both help with the understanding of a system in detail. Only linear systems can be represented in these diagrams (unless a non-linear system is linearised first) and from the diagrams the system transfer function can be readily obtained.

linear Time variant (LTV) and linear Time Invariant (LTI) Systems. If a system is both linear and time variant, then it is called linear time variant (LTV) system. If a system is both linear and time Invariant then that system is called linear time invariant (LTI) system. Static and Dynamic Systems. Static system is memory-less whereas dynamic ...

Signals that have finite duration are often called time-limitedsignals. For example, rectangular and triangular pulses are time-limited signals, but have infinite time durations. The properties of the convolution integral are: The slides contain the copyrighted material from Linear Dynamic Systems and Signals, Prentice Hall, 2003.

I had Zoran Gajic as a professor for Linear Systems and Signals, and I has this book as the text. This occurrence is usually frustrating as the discourse given on the blackboard in class is usually identical to the text that is presented in the book; this case was no different, and consequentially I rarely attended the lectures.
