The progressive development of civil engineering involves the development of already known methods and the search for new techniques for testing materials, elements, structures, and entire buildings. In these activities, much attention is focused on non-destructive testing (NDT) methods, which, in principle, do not interfere with the structures being tested.

### Non Destructive Testing applications in Civil Engineering

Non-destructive testing (NDT) is a testing and analysis technique used by industry to evaluate the properties of a material, component, structure or system for characteristic differences or welding defects and discontinuities without causing damage to the original part.

### What is Non-Destructive Testing (NDT)? Methods and ...

Non-destructive evaluation carried out using active infrared technique is based on the detection and recording of the temporal development of the total radiation flow transmitted from the surface of the object under inspection. The object must be placed in transient thermal regime by heating or cooling it during a relatively long period.
