Finally, CSP systems analysis also supports development and integration of advanced utility-scale solar financial models into the System Advisor Model (SAM). CSP is a unique form of solar energy because it can serve as a baseload power source, just like a coal or natural gas combined-cycle power plant, generating electricity on a 24-hour cycle.

The collector focuses, or concentrates, solar energy onto an absorber. The collector usually moves throughout the day so that it maintains a high degree of concentration on the absorber. Solar thermal power plants use concentrating solar collector systems because they can produce the high temperature heat needed to generate electricity.

The solar thermal system differs from solar photovoltaic in that the solar thermal power generation works through the concentration of sunlight to produce heat. The heat, in turn, drives a heat engine which turns a generator to make electrical energy. The energy is suitable for use in industries, commercial and residential sectors.
